| rheumatoid arthritis, systemic lupus | erythematosis, multiple sclerosis    | and/or as described below) and      | immunodeficiencies (e.g., as      | described below). Preferred     | indications include neoplastic       | diseases (e.g., leukemia, lymphoma, | melanoma, prostate, breast, lung, | colon, pancreatic, esophageal, | stomach, brain, liver, and urinary    | tract cancers and/or as described     | below under "Hyperproliferative    | Disorders"). Other preferred    | indications include benign | dysproliferative disorders and pre-  | neoplastic conditions, such as, for | example, hyperplasia, metaplasia, | and/or dysplasia. Preferred | indications include anemia,   | pancytopenia, leukopenia,     | thrombocytopenia, leukemias,       | Hodgkin's disease, acute            | lymphocytic anemia (ALL),           | plasmacytomas, multiple myeloma,     | Burkitt's lymphoma, arthritis, AIDS, | granulomatous disease, inflammatory | bowel disease, sepsis, neutropenia,   | neutrophilia, psoriasis, suppression   | of immune reactions to transplanted | organs and tissues, hemophilia,            | hypercoagulation, diabetes mellitus, | endocarditis, meningitis, and Lyme  | Disease.                         |                                     |                                    |                                  |                                  |

| regulate GATA3 transcription factors | and modulate expression of mast cell | genes important for immune response | development. Exemplary assays for | transcription through the GATA3 | response element that may be used or | routinely modified to test GATA3-   | response element activity of      | polypeptides of the invention  | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in Berger et al., | Gene 66:1-10 (1998); Cullen and | Malm, Methods in Enzymol   | 216:362-368 (1992); Henthorn et al., | Proc Natl Acad Sci USA 85:6342-     | 6346 (1988); Flavell et al., Cold | Spring Harb Symp Quant Biol | 64:563-571 (1999); Rodriguez- | Palmero et al., Eur J Immunol | 29(12):3914-3924 (1999); Zheng and | Flavell, Cell 89(4):587-596 (1997); | and Henderson et al., Mol Cell Biol | 14(6):4286-4294 (1994), the contents | of each of which are herein          | incorporated by reference in its    | entirety. Mast cells that may be used | according to these assays are publicly | available (e.g., through the        | ATCC <sup>TM</sup> ). Exemplary human mast | cells that may be used according to  | these assays include the HMC-1 cell | line, which is an immature human | mast cell line established from the | peripheral blood of a patient with | mast cell leukemia, and exhibits | many characteristics of immature |
|                                      |                                      |                                     |                                   |                                 |                                      |                                     |                                   |                                |                                       |                                       |                                    |                                 |                            |                                      |                                     |                                   |                             |                               |                               |                                    |                                     |                                     |                                      |                                      |                                     |                                       |                                        |                                     |                                            |                                      |                                     |                                  |                                     |                                    |                                  |                                  |

| activity that may be used or routinely | modified to test P13 kinase-induced | activity of polypeptides of the | invention (including antibodies and    | agonists or antagonists of the  | invention) include assays disclosed in | Forrer et al., Biol Chem 379(8-  | 9):1101-1110 (1998); Nikoulina et | al., Diabetes 49(2):263-271 (2000); | and Schreyer et al., Diabetes | 48(8):1662-1666 (1999), the contents | of each of which are herein        | incorporated by reference in its   | entirety. Mouse adipocyte cells that | may be used according to these | assays are publicly available (e.g., | through the ATCCTM). Exemplary       | mouse adipocyte cells that may be      | used according to these assays   | include 3T3-L1 cells. 3T3-L1 is an  | adherent mouse preadipocyte cell | line that is a continous substrain of | 3T3 fibroblast cells developed     | through clonal isolation and undergo | a pre-adipocyte to adipose-like  | conversion under appropriate        | differentiation conditions known in | the art.                     |                                     |                                |                                |                       |                                        |                                   |                                       |                                      |                                   |
|                                        |                                     |                                 |                                        |                                 |                                        |                                  |                                   |                                     |                               |                                      |                                    |                                    |                                      |                                |                                      |                                      |                                        |                                  |                                     |                                  |                                       |                                    |                                      |                                  |                                     |                                     |                              |                                     |                                |                                |                       |                                        |                                   |                                       |                                      |                                   |

Human Cells but may be used according to these assists may be solided using techniques disclosed herein or otherwise known in the art. Human Tedls are primary human lymphocytes that mature in human desprease at Tedl receptor and CD3, CD4, or CD8. These cells mediate humorel or cell-medical immunity and may be preadvived to enthance responsiveness to responsiveness to immunimomodulatory factors.                                                                                                                       | transaction through the Serum<br>Regesses Element (SRE) are well-<br>known in the art and may be used or<br>honown in the art and may be used or<br>honown in the art and may be used or<br>mainting or forphyperpides of the<br>ability of polyperpides of the<br>progression of programs of the<br>invention (robiding antibodies and<br>against or antegorises of the<br>invention) to regalate secun<br>invention) to regalate secun<br>invention) to regalate secun<br>to when the or program of<br>yours, have almost and modulate the<br>expression of genes involved in<br>copression of genes involved in<br>growth-related genes in many cell<br>of growth-related genes in many cell<br>through the SRE that<br>transactipion through the SRE and<br>transactipion through<br>the SRE activity of the polyperpides<br>transactipion through<br>transactivity of the polyperpides<br>transactivity of the polyperpide<br>transactivity of the polyperpide |

| Cullen and Malm, Methods in<br>Enzymol 216:362-368 (1992);<br>Henthom et al., Proc Natl Acad Sci<br>USA 85:6342-6346 (1988); Benson | et al., J Immunol 135(9):3862-3873<br>(1994), and Black et al., Virus Genes<br>12(2):105-117 (1997), the content of<br>each of which are herein  | incorporated by reference in its entirety. T cells that may be used according to these assays are publicity available (e.g., through the ATCC <sup>TM</sup> ). Exemplary T cells that | may be used according to these assays include the NK-YT cell line, which is a human natural killer cell line with cytolytic and cytotoxic activity.                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                         |

| 6 | HATBR65 | 423 | Production of IL-6 | IL-6 FMAT. IL-6 is produced by T<br>cells and has strong effects on B<br>cells. IL-6 principacies in IL-4<br>induced leg production and increases<br>legs production (e.g. phys a role in<br>muscust immunity). IL-6 induces<br>expression of IL-6 has been inhed to<br>covorics T cells. Dergalandel<br>expression of IL-6 has been inhed to<br>myelomas, and oltonio<br>hyperpolificative diseases. Assays<br>for immunomaliatory and differentiation factor proteins<br>hyperpolificative diseases. Assays<br>differentiation factor proteins<br>showted by a ladge winey of cells<br>where the expression level is strongly. | meneplasis, and/or dysplusia.  Halpin preterred ambuliment of the invention includes a method for increasing) Life production. An alternative lightly preduction to a later of the invention includes a method for invention includes a simulation or enhancement of innewal immunity. Highly preferred infections anchold below under "Immune Activity" is also distorders (a and or standors and or standors and includes and sinceders (a. as described below under "Immune Activity").                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| regulated by cytokines, growin         | infection (e.g., as described below    |
|----------------------------------------|----------------------------------------|
| factors, and hormones are well         | under "Infectious Disease"). Highly    |
| known in the art and may be used or    | preferred indications include          |
| routinely modified to assess the       | autoimmune diseases (e.g.,             |
| ability of polypeptides of the         | rheumatoid arthritis, systemic lupus   |
| invention (including antibodies and    | erythematosis, multiple sclerosis      |
| agonists or antagonists of the         | and/or as described below) and         |
| invention) to mediate                  | immunodeficiencies (e.g., as           |
| immunomodulation and                   | described below). Highly preferred     |
| differentiation and modulate T cell    | indications also include boosting a B  |
| proliferation and function.            | cell-mediated immune response and      |
| Exemplary assays that test for         | alternatively suppressing a B cell-    |
| immunomodulatory proteins evaluate     | mediated immune response. Highly       |
| the production of cytokines, such as   | preferred indications include          |
| IL-6, and the stimulation and          | inflammation and inflammatory          |
| upregulation of T cell proliferation   | disorders. Additional highly preferred |
| and functional activities. Such        | indications include asthma and         |
| assays that may be used or routinely   | allergy. Highly preferred indications  |
| modified to test immunomodulatory      | include neoplastic diseases (e.g.,     |
| and diffferentiation activity of       | myeloma, plasmacytoma, leukemia,       |
| polypeptides of the invention          | lymphoma, melanoma, and/or as          |
| (including antibodies and agonists or  | described below under                  |
| antagonists of the invention) include  | "Hyperproliferative Disorders").       |
| assays disclosed in Miraglia et al., J | Highly preferred indications include   |
| Biomolecular Screening 4:193-          | neoplasms and cancers, such as,        |
| 204(1999); Rowland et al.,             | myeloma, plasmacytoma, leukemia,       |
| "Lymphocytes: a practical approach"    | lymphoma, melanoma, and prostate,      |
| Chapter 6:138-160 (2000); and          | breast, lung, colon, pancreatic,       |
| Verhasselt et al., J Immunol           | esophageal, stomach, brain, liver and  |
| 158:2919-2925 (1997), the contents     | urinary cancer. Other preferred        |
| of each of which are herein            | indications include benign             |
| incorporated by reference in its       | dysproliferative disorders and pre-    |
| entirety. Human dendritic cells that   | neoplastic conditions, such as, for    |
| may be used according to these         | example, hyperplasia, metaplasia,      |
| assays may be isolated using           | and/or dysplasia. Preferred            |
| techniques disclosed herein or         | indications include anemia,            |
| otherwise known in the art. Human      | pancytopenia, leukopenia,              |

| I thrombocytopenii, Hodgkiri, et dissee, aute lymphocyte anenie (ALL), mrlipte myotoma. Burkiri symphoma, et myotoma, burkiri symphoma, et missa, AIDS, gamuhomatous disseae, inflammatony howed tiessee, spissis, neuropenia, roetneophiia, poetisis, suppression organis, and the commer restories to transplanted organs and itsuse, kernophila, poetisis, and the conformation of miderion in friend in different difficulties in friendin (i.g., an infection dissease as described below midericitous disseases. In additional proferred indication is infection (i.g., an infection dissease as described below mider "lifectious Disseas"). | A highly pretirent indication is diabetes mellinas.  A highly pretirent indication is a complication pretirent indication is a complication associated with diabetes (e.g., diabetic retinopathy, diabetic retinopathy, diabetic retinopathy is diabetic retinopathy is diabetic retinopathy and adverted reasons and disabetic retinopathy and about the fall fall fall fall fall fall fall fal                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|       | disregulation is a key component in | madetes. Exemplary assays mat may   | be used or routinely modified to test | for stimulation of insulin secretion | (from pancreatic cells) by       | polypeptides of the invention       | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in: Shimizu, H., et | al., Endocr J, 47(3):261-9 (2000); | Salapatek, A.M., et al., Mol       | Endocrinol, 13(8):1305-17 (1999); | Filipsson, K., et al., Ann N Y Acad | Sci, 865:441-4 (1998); Olson, L.K., | et al., J Biol Chem, 271(28):16544- | 52 (1996); and, Miraglia S et. al.,    | Journal of Biomolecular Screening,  | 4:193-204 (1999), the contents of   | each of which is herein incorporated | by reference in its entirety. | Pancreatic cells that may be used   | according to these assays are publicly | available (e.g., through the ATCC <sup>TM</sup> ) | and/or may be routinely generated. | Exemplary pancreatic cells that may    | be used according to these assays    | include HTTT15 Cells. HTTT15 are     | an adherent epithelial cell line   | established from Syrian hamster islet  | cells transformed with SV40. These | cells express glucagon, somatostatin, | and glucocorticoid receptors. The | cells secrete insulin, which is | stimulated by glucose and glucagon | and suppressed by somatostatin or | glucocorticoids. ATTC# CRL-1777 | Refs: Lord and Ashcroft. Biochem. |

| Randor may be routinely generated.  Randpalo protectic cells falte may be used acousting to these assays the class of the | Assays for the regulation of vibility and polification of cells in vitro are used-tensor in the art and may be used or routinely modified to assess the shility of polyperpides of the invention (including anthedreis and agonists or antagonists of the provided polyperpides of the invention) to regulate vibility and polyfication of pancratic beta cells. In custance, the Cell Three-fol luminescent cell viability assay in culture based on quantitation of measures the number of visible cells in culture based on quantitation of the ATP present which signals the presence of methodically active profileration of viability and active the profileration of viability and active the method of the invention of viability and calculating antidoxis and geomiss or damagoniss of the invention included antigoniss of the invention included antigoniss of the invention in cluded antigoniss of the invention of the profession of the profession of the profession of the profession of the invention of the preserved of the invention of the cluded antigonism of the profession of the |

|   |  | eating disorders, fibrosis, cachexia,   |
|   |  | and kidney diseases or disorders.       |
|   |  | Highly preferred indications include    |
|   |  | neoplasms and cancer, such as,          |
|   |  | lipoma, liposarcoma, lymphoma,          |
|   |  | leukemia and breast, colon, and         |
|   |  | kidney cancer. Additional highly        |
|   |  | preferred indications include           |
|   |  | melanoma, prostate, lung,               |
|   |  | pancreatic, esophageal, stomach,        |
|   |  | brain, liver, and urinary cancer.       |
|   |  | Other preferred indications include     |
|   |  | benign dysproliferative disorders and   |

| pre-neoplastic conditions, such as,<br>for example, hyperplasia, metaplasia,<br>and/or dysplasia. | A highly preferred indication is | obesity and/or complications   | associated with obesity. Additional | highly preferred indications include | weight loss or alternatively, weight | gain. An additional highly preferred | indication is diabetes mellitus. An   | additional highly preferred indication | is a complication associated with | diabetes (e.g., diabetic retinopathy, | diabetic nephropathy, kidney disease | (e.g., renal failure, nephropathy   | and/or other diseases and disorders as | described in the "Renal Disorders"    | section below), diabetic neuropathy, | nerve disease and nerve damage      | (e.g., due to diabetic neuropathy), | blood vessel blockage, heart disease, | stroke, impotence (e.g., due to       | diabetic neuropathy or blood vessel | blockage), seizures, mental        | confusion, drowsiness, nonketotic  | hyperglycemic-hyperosmolar coma,     | cardiovascular disease (e.g., heart | disease, atherosclerosis,    | microvascular disease, hypertension, | stroke, and other diseases and        | disorders as described in the         | "Cardiovascular Disorders" section | below), dyslipidemia, endocrine | disorders (as described in the | "Endocrine Disorders" section        | below), neuropathy, vision      | impairment (e.g., diabetic retinopathy |
|---------------------------------------------------------------------------------------------------|----------------------------------|--------------------------------|-------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|---------------------------------------|----------------------------------------|-----------------------------------|---------------------------------------|--------------------------------------|-------------------------------------|----------------------------------------|---------------------------------------|--------------------------------------|-------------------------------------|-------------------------------------|---------------------------------------|---------------------------------------|-------------------------------------|------------------------------------|------------------------------------|--------------------------------------|-------------------------------------|------------------------------|--------------------------------------|---------------------------------------|---------------------------------------|------------------------------------|---------------------------------|--------------------------------|--------------------------------------|---------------------------------|----------------------------------------|
|                                                                                                   | Assays for the activation of     | transcription through the cAMP | response element are well-known in  | the art and may be used or routinely | modified to assess the ability of    | polypeptides of the invention        | (including antibodies and agonists or | antagonists of the invention) to       | increase cAMP, regulate CREB      | transcription factors, and modulate   | expression of genes involved in a    | wide variety of cell functions. For | example, a 3T3-L1/CRE reporter         | assay may be used to identify factors | that activate the cAMP signaling     | pathway. CREB plays a major role in | adipogenesis, and is involved in    | differentiation into adipocytes. CRE  | contains the binding sequence for the | transcription factor CREB (CRE      | binding protein). Exemplary assays | for transcription through the cAMP | response element that may be used or | routinely modified to test cAMP-    | response element activity of | polypeptides of the invention        | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in Berger et al., | Gene 66:1-10 (1998); Cullen and | Malm, Methods in Enzymol       | 216:362-368 (1992); Henthorn et al., | Proc Natl Acad Sci USA 85:6342- | 6346 (1988); Reusch et al., Mol Cell   |
|                                                                                                   | Activation of                    | transcription through          | cAMP response                       | element (CRE) in pre-                | adipocytes.                          |                                      |                                       |                                        |                                   |                                       |                                      |                                     |                                        |                                       |                                      |                                     |                                     |                                       |                                       |                                     |                                    |                                    |                                      |                                     |                              |                                      |                                       |                                       |                                    |                                 |                                |                                      |                                 |                                        |
|                                                                                                   | 431                              |                                |                                     |                                      |                                      |                                      |                                       |                                        |                                   |                                       |                                      |                                     |                                        |                                       |                                      |                                     |                                     |                                       |                                       |                                     |                                    |                                    |                                      |                                     |                              |                                      |                                       |                                       |                                    |                                 |                                |                                      |                                 |                                        |

| HBJLC01 | 431 | Production of IL-6 | L-6 FMAT. IL-6 is produced by T cells and has strong effects on B cells. IL-6 participates in IL-4                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | meningus, and Lyme Disease.  A highly preferred embodiment of the invention includes a method for stimulating (e.g., increasing) IL-6                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Assays for immunormodulatory proteins that induce chemotaxis of T cells, monocytes, and cosinophils are well                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| known in the art and may be used or<br>routinely modified to assess the | ability of polypeptides of the | agonists or antagonists of the | invention) to mediate | immunomodulation, induce | chemotaxis, and/or mediate humoral | or cell-mediated immunity. | Exemplary assays that test for | immunomodulatory proteins evaluate | the production of cytokines, such as | RANTES, and the induction of | chemotactic responses in immune | cells. Such assays that may be used | or routinely modified to test | immunomodulatory activity of | polypeptides of the invention | (including antibodies and agonists or | antagonists of the invention) include | the assays disclosed in Miraglia et | al., J Biomolecular Screening 4:193- | 204 (1999); Rowland et al., | "Lymphocytes: a practical approach" | Chapter 6:138-160 (2000): Cocchi et | al., Science 270(5243):1811-1815 | (1995); and Robinson et al., Clin Exp | Immunol 101(3):398-407 (1995), the | contents of each of which are herein | incorporated by reference in its | entirety. Endothelial cells that may | be used according to these assays are | publicly available (e.g., through the | ATCC <sup>TM</sup> ). Exemplary endothelial | cells that may be used according to | these assays include human umbilical | vein endothelial cells (HUVEC), |

| may be used or routinely modified to assess the ability of polypeptides of the invention (including authodies and agonists or antagonists of the invention) to stimulate insulin | secretion. For example, insulin secretion is measured by FMAT using anti-rat insulin antibodies. Insulin secretion from pancreatic beta                | cells is upregulated by glucose and also by certain proteins/peptides, and disregulation is a key component in diabetes. Exemplary assays that may be used or routinely modified to test | for stimulation of installi secretion (from pancreatic cells) by polypoptides of the invention (including antibodies and agonists or anagonists of the invention) include assays disclosed in: Shimiza, H., et     | all, Fatoor 1, 4(7)251-9 (2000);<br>Salaparek, AM, et al., Mol<br>Endoerinol, 13(8):1305-17 (1999);<br>Filipsson, K., et al., Ann N Y Acad<br>Sci, 865-441-4 (1998; Olson, L.K.,<br>et al., J Biol Chem, 271(28):16544-<br>52 (1996); and, Miraglia S et al., | organia on nonmediate accounts,<br>41(93-20t (1999), the contents of<br>and of which is herein incorporated<br>by reference in its entirely.<br>Percentice of the ann my be task<br>according to these assays are publicly<br>andror may be routinely the ATCC**)<br>andror may be routinely the ATCC**)<br>andror may be routinely agreement.<br>Exemplary pure accounts cells that may<br>be used according to these assays. |

| Apoptosis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | known in the art and may be used or  | routinely modified to assess the | ability of the polypeptides of the | invention (including antibodies and | agonists or antagonists of the    | invention) to inhibit caspase | protease-mediated apoptosis.    | Exemplary assays for caspase | apoptosis that may be used or        | routinely modified to test caspase | apoptosis rescue of polypeptides of | the invention (including antibodies | and agonists or antagonists of the | invention) include the assays | disclosed in Romeo et al., Cardiovasc | Res 45(3): 788-794 (2000); Messmer | et al., Br J Pharmacol 127(7): 1633- | 1640 (1999); and J Atheroscler | Thromb 3(2): 75-80 (1996); the   | contents of each of which are herein | incorporated by reference in its | entirety. Endothelial cells that may | be used according to these assays are | publicly available (e.g., through      | commercial sources). Exemplary | endothelial cells that may be used      | according to these assays include    | bovine aortic endothelial cells | (bAEC), which are an example of | endothelial cells which line blood | vessels and are involved in functions | that include, but are not limited to, | angiogenesis, vascular permeability, | vascular tone, and immune cell    | extravasation.              |                                 |                                  |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Apoptosis.                           |                                  |                                    |                                     |                                   |                               |                                 |                              |                                      |                                    |                                     |                                     |                                    |                               |                                       |                                    |                                      |                                |                                  |                                      |                                  |                                      |                                       |                                        |                                |                                         |                                      |                                 |                                 |                                    |                                       |                                       |                                      |                                   |                             |                                 |                                  |

|  | - Carren | myopamy, varvam                         |
|  | regurg   | regurgitation, left ventricular         |
|  | dysfu    | dysfunction, atherosclerosis and        |
|  | athero   | atherosclerotic vascular disease,       |
|  | diabet   | diabetic nephropathy, intracardiac      |
|  | shunt    | shunt, cardiac hypertrophy,             |
|  | myoc     | myocardial infarction, chronic          |
|  | hemor    | hemodynamic overload, and/or as         |
|  | descri   | described below under                   |
|  | "Card    | "Cardiovascular Disorders"). Highly     |
|  | lprefer  | preferred indications include           |
|  | cardio   | cardiovascular, endothelial and/or      |
|  | angio    | angiogenic disorders (e.g., systemic    |
|  | disord   | disorders that affect vessels such as   |
|  | diabet   | diabetes mellitus, as well as diseases  |
|  | of the   | of the vessels themselves, such as of   |
|  | the ar   | the arteries, capillaries, veins and/or |
|  | lympl    | lymphatics). Highly preferred are       |
|  | indica   | indications that stimulate              |
|  | angio    | angiogenesis and/or                     |
|  | cardio   | cardiovascularization. Highly           |
|  | prefer   | preferred are indications that inhibit  |
|  | angio    |                                         |
|  | cardio   | cardiovascularization. Highly           |
|  | nejerd   | preferred indications include           |
|  | antian   | antiangiogenic activity to treat solid  |
|  | tumor    | tumors, leukemias, and Kaposi"s         |
|  | sarcor   | sarcoma, and retinal disorders.         |
|  | Highl    | Highly preferred indications include    |
|  | ldoəu    | neoplasms and cancer, such as,          |
|  | Kapos    | Kaposi"s sarcoma, hemangioma            |
|  | (capil   | (capillary and cavernous), glomus       |
|  | tumor    | tumors, telangiectasia, bacillary       |
|  | angion   | angiomatosis,                           |
|  | hemai    | hemangioendothelioma,                   |
|  | angio    | angiosarcoma,                           |
|  | haems    | haemangiopericytoma,                    |

|  | lymphangioma, lymphangiosarcoma.       |
|--|----------------------------------------|
|  | Hiohly preferred indications also      |
|  | include cancers such as, prostate,     |
|  | breast, lung, colon, pancreatic,       |
|  | esophageal, stomach, brain, liver,     |
|  | and urinary cancer. Preferred          |
|  | indications include benign             |
|  | dysproliferative disorders and pre-    |
|  | neoplastic conditions, such as, for    |
|  | example, hyperplasia, metaplasia,      |
|  | and/or dysplasia. Highly               |
|  | preferred indications also include     |
|  | arterial disease, such as,             |
|  | atherosclerosis, hypertension,         |
|  | coronary artery disease,               |
|  | inflammatory vasculitides,             |
|  | Reynaud"s disease and Reynaud"s        |
|  | phenomenom, aneurysms, restenosis;     |
|  | venous and lymphatic disorders such    |
|  | as thrombophlebitis, lymphangitis,     |
|  | and lymphedema; and other vascular     |
|  | disorders such as peripheral vascular  |
|  | disease, and cancer. Highly            |
|  | preferred indications also include     |
|  | trauma such as wounds, burns, and      |
|  | injured tissue (e.g., vascular injury  |
|  | such as, injury resulting from balloon |
|  | angioplasty, and atheroschlerotic      |
|  | lesions), implant fixation, scarring,  |
|  | ischemia reperfusion injury,           |
|  | rheumatoid arthritis, cerebrovascular  |
|  | disease, renal diseases such as acute  |
|  | renal failure, and osteoporosis.       |
|  | Additional highly preferred            |
|  | indications include stroke, graft      |
|  | rejection, diabetic or other           |
|  | retinopathies, thrombotic and          |

|         |          |                                                                                                     |                                                                                                                                                                                                                                                                                                                                                        | coagulative disorders, vascularitis, lymph augogenesis, sevual disorders, age-related macular degeneration, and treatment prevention, and treatment prevention of endomericisis and prevention of endomericisis and related conditions. Additional highly related conditions. Additional highly                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| disease as described below under      | information and inflammatory    | disorders. Preferred indications also | include blood disorders (e.g., as | described below under "Immune | Activity", "Blood-Related         | Disorders", and/or "Cardiovascular | Disorders"). Preferred indications    | include autoimmune diseases (e.g., | rheumatoid arthritis, systemic lupus | erythematosis, multiple sclerosis    | and/or as described below) and      | immunodeficiencies (e.g., as      | described below). Preferred     | indications include neoplastic       | discases (e.g., leukemia, lymphoma, | melanoma, prostate, breast, lung, | colon, pancreatic, esophageal, | stomach, brain, liver, and urinary    | tract cancers and/or as described     | below under "Hyperproliferative    | Disorders"). Other preferred    | indications include benign | dysproliferative disorders and pre-  | neoplastic conditions, such as, for | example, hyperplasia, metaplasia, | and/or dysplasia. Preferred | indications include anemia,   | pancytopenia, leukopenia,     | thrombocytopenia, leukemias,       | Hodgkin's disease, acute            | lymphocytic anemia (ALL),           | plasmacytomas, multiple myeloma,     | Burkitt's lymphoma, arthritis, AIDS, | granulomatous disease, inflammatory | bowel disease, sepsis, neutropenia,   |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 447                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | HCWKC15                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 43                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Disorders", and/or "Cardiovascular | Disorders"). Preferred indications    | include autoimmune diseases (e.g., | rheumatoid arthritis, systemic lupus | erythematosis, multiple sclerosis    | and/or as described below) and      | immunodeficiencies (e.g., as      | described below). Preferred     | indications include neoplastic       | discases (e.g., leukemia, lymphoma, | melanoma, prostate, breast, lung, | colon, pancreatic, esophageal, | stomach, brain, liver, and urinary    | tract cancers and/or as described     | below under "Hyperproliferative    | Disorders"). Other preferred    | indications include benign | dysproliferative disorders and pre-  | neoplastic conditions, such as, for | example, hyperplasia, metaplasia, | and/or dysplasia. Preferred | indications include anemia,   | pancytopenia, leukopenia,     | thrombocytopenia, leukemias,       | Hodgkin's disease, acute            | lymphocytic anemia (ALL),           | plasmacytomas, multiple myeloma,     | Burkitt's lymphoma, arthritis, AIDS, | granulomatous disease, inflammatory | bowel disease, sepsis, neutropenia,   | neutrophilia, psoriasis, suppression   | of immune reactions to transplanted | organs and tissues, hemophilia,            | hypercoagulation, diabetes mellitus, | endocarditis, meningitis, and Lyme  | Disease.                         |                                     |

In human mast cell line, Activation of NFBB immast cell line, Activation of NFBB im mast certain cytokiens, such as IL-6 and the properties of the activation of transcripton intrough the NFBB response centent are well-known in transcripton intrough the NFBB response centent are well-known in modified to assess the ability of propeptides of the invention (including antibodies and agonists or amagonists of the invention) to regulate NFBB invascription faces and ondulate cepessistion of automational conference of the control of the control of the invention to regulate NFBB invascription faces and modulate cepessistion of intrammomodulatory series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|  |  | described below under "Immune          |
|--|--|----------------------------------------|
|  |  | Activity", "Cardiovascular             |
|  |  | Disorders", and/or "Blood-Related      |
|  |  | Disorders"), immune disorders (e.g.,   |
|  |  | as described below under "Immune       |
|  |  | Activity"), and infection (e.g., as    |
|  |  | 2                                      |
|  |  | Disease"). A highly preferred          |
|  |  | indication is diabetes mellitus.       |
|  |  | An additional highly preferred         |
|  |  | indication is a complication           |
|  |  | associated with diabetes (e.g.,        |
|  |  | diabetic retinopathy, diabetic         |
|  |  | nephropathy, kidney disease (e.g.,     |
|  |  | renal failure, nephropathy and/or      |
|  |  | other diseases and disorders as        |
|  |  | described in the "Renal Disorders"     |
|  |  | section below), diabetic neuropathy,   |
|  |  | nerve disease and nerve damage (e.g,   |
|  |  | due to diabetic neuropathy), blood     |
|  |  | vessel blockage, heart disease,        |
|  |  | stroke, impotence (e.g., due to        |
|  |  | diabetic neuropathy or blood vessel    |
|  |  | blockage), seizures, mental            |
|  |  | confusion, drowsiness, nonketotic      |
|  |  | hyperglycemic-hyperosmolar coma,       |
|  |  | cardiovascular disease (e.g., heart    |
|  |  | disease, atherosclerosis,              |
|  |  | microvascular disease, hypertension,   |
|  |  | stroke, and other diseases and         |
|  |  | disorders as described in the          |
|  |  | "Cardiovascular Disorders" section     |
|  |  | below), dyslipidemia, endocrine        |
|  |  | disorders (as described in the         |
|  |  | "Endocrine Disorders" section          |
|  |  | below), neuropathy, vision             |
|  |  | impairment (e.g., diahetic retinonathy |

|  | and blindness), ulcers and impaired<br>wound healing, infections (e.g., |
|--|-------------------------------------------------------------------------|
|  | infectious diseases and disorders as                                    |
|  | described in the "Infectious Diseases" section below especially         |
|  | of the urinary tract and skin), carpal                                  |
|  | ×                                                                       |
|  | contracture). An additional<br>highly preferred indication is obesity   |
|  | and/or complications associated with                                    |
|  | obesity. Additional highly preferred                                    |
|  | indications include weight loss or                                      |
|  | alternatively, weight gain.                                             |
|  | indications are complications                                           |
|  | associated with insulin resistance.                                     |
|  | Additional highly preferred                                             |
|  | indications are disorders of the                                        |
|  | musculoskeletal system including                                        |
|  | myopathies, muscular dystrophy,                                         |
|  | and/or as described herein.                                             |
|  | Additional highly preferred                                             |
|  | indications include: myopathy,                                          |
|  | atrophy, congestive heart failure,                                      |
|  | cachexia, myxomas, fibromas,                                            |
|  | congenital cardiovascular                                               |
|  | abnormalities, heart disease, cardiac                                   |
|  |                                                                         |
|  | vascular disease. Highly                                                |
|  | preferred indications include                                           |
|  | neoplasms and cancer, such as,                                          |
|  | rhabdomyoma, rhabdosarcoma,                                             |
|  | stomach, esophageal, prostate, and                                      |
|  | urinary cancer. Preferred indications                                   |
|  | also include breast, lung, colon,                                       |
|  | pancreatic, brain, and liver cancer.                                    |
|  | Other preferred indications include                                     |

| benign dysproliferative disorders and<br>pre-neoplastic conditions, such as,<br>hyperplasia, metaplasia, and/or<br>dysplasia. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                     | Assays for the regulation of     | transcription through the FAS | promoter element are well-known in     | the art and may be used or routinely | modified to assess the ability of     | polypeptides of the invention        | (including antibodies and agonists or | antagonists of the invention) to       | activate the FAS promoter element in | a reporter construct and to regulate | transcription of FAS, a key enzyme | for lipogenesis. FAS promoter is    | regulated by many transcription       | factors including SREBP. Insulin | increases FAS gene transcription in | livers of diabetic mice. This | stimulation of transcription is also | somewhat glucose dependent.      | Exemplary assays that may be used   | or routinely modified to test for FAS | promoter element activity (in        | hepatocytes) by polypeptides of the | invention (including antibodies and | agonists or antagonists of the     | invention) include assays disclosed in | Xiong, S., et al., Proc Natl Acad Sci | U.S.A., 97(8):3948-53 (2000); | Roder, K., et al., Eur J Biochem, | 260(3):743-51 (1999); Oskouian B,      | et al., Biochem J, 317 ( Pt 1):257-65 | (1996); Berger, et al., Gene 66:1-10 | (1988); and, Cullen, B., et al.,     | Methods in Enzymol. 216:362-368 | (1992), the contents of each of which | is herein incorporated by reference in | its entirety. Hepatocytes that may be |

| invention includes a method for      | production. A highly preferred     | indication is infection (e.g., an   | infectious disease as described below | under "Infectious Disease"). | Additional highly preferred | indications include inflammation and | inflammatory disorders. Preferred | indications include blood disorders | (e.g., as described below under     | "Immune Activity", "Blood-Related | Disorders", and/or "Cardiovascular | Disorders"). Highly preferred | indications include autoimmune     | diseases (e.g., rheumatoid arthritis, | systemic lupus erythematosis,     | multiple sclerosis and/or as described | below) and immunodeficiencies (e.g., | as described below). Preferred        | indications also include anemia,      | pancytopenia, leukopenia,              | thrombocytopenia, Hodgkin's   | disease, acute lymphocytic anemia | (ALL), plasmacytomas, multiple      | myeloma, Burkitt's lymphoma, | arthritis, AIDS, granulomatous  | disease, inflammatory bowel disease, | sepsis, neutropenia, neutrophilia, | psoriasis, suppression of immune   | reactions to transplanted organs and | tissues, hemophilia,             | hypercoagulation, diabetes mellitus, | endocarditis, meningitis (bacterial | and viral), Lyme Disease, asthma, | and allergy Preferred indications | ales include negationic diceoces (a c |
| are well known in the art and may be | the ability of polypeptides of the | invention (including antibodies and | agonists or antagonists of the        | invention) to mediate        | immunomodulation, induce    | chemotaxis, and modulate immune      | cell activation. Exemplary assays | that test for immunomodulatory      | proteins evaluate the production of | cell surface markers, such as     | monocyte chemoattractant protein   | (MCP), and the activation of  | monocytes and T cells. Such assays | that may be used or routinely         | modified to test immunomodulatory | and differentiation activity of        | polypeptides of the invention        | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in Miraglia et al., J | Biomolecular Screening 4:193- | 204(1999); Rowland et al.,        | "Lymphocytes: a practical approach" | Chapter 6:138-160 (2000);    | Satthaporn and Eremin, J R Coll | Surg Ednb 45(1):9-19 (2001); and     | Verhasselt et al., J Immunol       | 158:2919-2925 (1997), the contents | of each of which are herein          | incorporated by reference in its | entirety. Human dendritic cells that | may be used according to these      | assays may be isolated using      | techniques disclosed herein or    | othorwice brown in the ort Human      |

| important in the pathogenesis of | asthma. Exemplary assays for | transcription through the NFKB | response element that may be used or | rountinely modified to test NFKB- | response element activity of | polypeptides of the invention | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in Berger et al., | Gene 66:1-10 (1998); Cullen and | Malm, Methods in Enzymol | 216:362-368 (1992); Henthorn et al., | Proc Natl Acad Sci USA 85:6342- | 6346 (1988); Marone et al, Int Arch | Allergy Immunol 114(3):207-17 | (1997), the contents of each of which | are herein incorporated by reference | in its entirety. Cells were pretreated | with SID supernatants or controls for | 15-18 hours, and then 10 ng/mL of | TNF was added to stimulate the | NFkB reporter. SEAP activity was | measured after 48 hours. Basophils | that may be used according to these | assays are publicly available (e.g., | through the ATCCTM). Exemplary | human basophil cell lines that may be | used according to these assays | include Ku812, originally established | from a patient with chronic | myelogenous leukemia. It is an | immature prebasophilic cell line that | can be induced to differentiate into | mature basophils. See, Kishi et al., | Leuk Res. 9:381-390 (1985); Blom et | al., Eur J Immunol, 22:2025-32 |

| * | HDPND46 | 885 | Production of IL-4 | ILL-HWMT Assays for immanoancellatory proteins secreted by TH2 cells that stimulate b cells. The cells immanoancellatory proteins secreted by TH2 cells that stimulate b cells. The cells immanoancellatory proteins secreted and promote polarization of CD44 and promote polarization of CD44 and the standard may be used or in the strained may be used or in the ability of polypeptides or the animation cells and the ability of polypeptides of the immanoancellation stimulation of immano or cell-incidiated immanity or cell-incidiated immanity or cell-incidiated immanity or cells. The and the atimulation of immanoancellatory in animation of immanoancellatory in the animation of animation anima | A highly preferred embodiment for the invention includes a method for stimulating (e.g., increasing) IL—4 production. An informative highly preferred embodiment of the inhibiting (e.g., reducing) IL—4 production. A highly preferred demodration of the inhibiting (e.g., reducing) IL—4 production. A highly preferred indication includes suffame. A highly preferred indication includes suffame. A highly preferred indication includes suffame and indication includes in the inhibition of the inhibition include indications include inflammatory deaded: Eighty preferred indications include inflammatory deaded. Highly preferred indications include inflammatory deaded in the inhibition of the conferred indications include exceptible below that symptoms, mechanism and prostate, these, lung, someth, brain, liver and trining someth, brain, liver and training enables being appropriate in the inhibition of the profetred indications and prevently latest disorders and preve |
